

Quarterly Systems Reliability Report

This synthetic report is used to validate dense annotation on PDF reader surfaces. It contains headings, paragraphs, a simple table, and a labeled figure so the extraction pipeline can be checked against a realistic mix of document content.

Table 1. Release Validation Metrics

Metric	Observed	Target
Availability	99.97%	99.90%
P95 latency	184 ms	< 220 ms
Failed jobs	3	< 8
Hotfixes	1	< 2

Figure 1. Service topology sketch

Summary

The release met all service-level objectives. Operator-visible incidents dropped, rollback time improved, and batch backfill jobs finished within the planned window.

Appendix A. Deployment Notes

- Staging soak time was extended from 6 to 10 hours.
- The Europe-West replica was promoted during the March maintenance window.
- The backup restore drill recovered 1.4 TB in 37 minutes.
- Runbook update R-219 added a branch for queue-depth mitigation.

Operator checklist

1. Verify dashboards are green.
2. Confirm alert routing and on-call ownership.
3. Check replication lag, worker queue depth, and canary response time.
4. Archive screenshots and incident notes in the release folder.

Example command

```
kubectl rollout status deploy/api --timeout=180s  
python tools/check_release.py --env prod --report metrics.csv  
tar -czf release_bundle.tgz notes.md screenshots/ metrics.csv
```
